

Optimizing Customer Experience in Food Delivery Apps

Presented By:
Akhil Jagarlamudi,
Arina Konnova,
Maria Yakovlev,
Yang Yu, Baraa Zekeria

01 | Our Research Question

- Convenience is a major contributor to customer satisfaction with food delivery apps
- Customer satisfaction is the most influential factor on the demand curve of services or products

Hypothesis: if we **artificially increase the expected waiting time** shown on DoorDash, then **customer satisfaction** will exhibit a **significant change**.

02 | Experimental Protocol

Timeline

We ran the experiment over the course of a month (four weeks).

Treatment

We artificially adjusted the expected wait time on participants' DoorDash interfaces by adding 5%, 10%, and 15% increases relative to the original estimated delivery time.

Sampling

We recruited from the existing app user pool, if users:

- lived in the LA area
- regularly used the app
- consented to a change to the app terms regarding the exp.

Randomization & Data

We randomized assignment to groups at the order level, and collected the relevant data from DoorDash's existing data logs.

03 | Results: EDA

Very clear increase in average cancellation rate as buffer time increases

Very little visible difference in average satisfaction rating across treatment groups

Little visible difference in avg. satisfaction rating across frequency of customer orders

03 | Results: Tukey Honestly Significant Difference

- Treatment 2 (10%) & Treatment 3 (15%) had a statistically significant effect on customer satisfaction
- Satisfaction level doesn't significantly differ between treatment groups
- Wider confidence intervals → uncertainty in mean differences

03 | Results: Regression

	estimate	std.Error	t_value	p_value	sig_lvl
(Intercept)	4.0401260494	0.027597145	146.3965227	0.000000e+00	$p < 0.05$
AvgWaitTime	-0.0009370888	0.000905274	-1.0351438	3.006222e-01	$0.1 \leq p < 0.5$
BufferTimePercentage	-0.0029543029	0.002634472	-1.1214025	2.621386e-01	$0.1 \leq p < 0.5$
actualDeliveryTime	-0.0386530082	0.007729499	-5.0007133	5.790872e-07	$p < 0.05$
expectedDeliveryTime	0.0150375470	0.007167013	2.0981609	3.591135e-02	$p < 0.05$
cancellation	0.0048527375	0.014347380	0.3382316	7.351944e-01	$p \geq 0.5$

- Longer actual delivery times have a negative impact on customer satisfaction
 - $\beta = -0.0387$
- Expected deliver has a positive impact
 - $\beta = 0.0150$
- Other variables doesn't show significant association with satisfaction

04 | Limitations & Next Steps

Limitations:

- Selection Bias
 - Geographic limitation to Los Angeles
- Sample pool
 - Samples are drawn only from frequent users of doordash
- Short Term vs Long Term Effects
 - Ignores long-term user retention impact.

Next Steps:

- Broader Geographic Sampling
 - Test in various regions
- Longitudinal Study
 - Track long-term effects on behavior, satisfaction, and loyalty.

Thank You!
